Intro Physics Semester I   **Name:**

Homework III: Thermodynamics III: Entropy and 2nd Law One or two full answer questions will be marked. There will also be a mark for completeness. Homeworks are due usually the day after the chapter they are for is finished. Solutions will be posted soon thereafter. The solutions are intended to be (but not necessarily are) super-perfect and often go beyond a fully correct answer.

1. "Let's play *Jeopardy*! For $100, the answer is: A device that operates in a cycle. It extracts heat from a hot reservoir and converts some fraction of this heat into macroscopic work and rejects the rest of the heat to a cold reservoir. The hot reservoir is at higher temperature than the cold resevoir as the names suggest."

   What is a _____, Alex?

   a) working fluid   b) piston   c) cylinder   d) refrigerator   e) heat engine

   SUGGESTED ANSWER: (e)

   Wrong answers:
   a) A heat engine needs a working fluid.
   d) Sort of the opposite of a heat engine or a heat engine in reverse. Either way not the best answer.

2. The three main components of a heat engine are a hot reservoir, a cold reservoir, and a _____. The _____ is a substance sample (usually a gas at least part of the time during an engine cycle) that absorbs heat from a hot reservoir, rejects heat to a cold and performs the macroscopic work of the engine. At the end of an engine cycle, the _____ has returned to its original thermodynamic state.

   a) valve   b) idling stuff   c) working fluid   d) engine fluid   e) radiator

   SUGGESTED ANSWER: (c)

4. "Let's play *Jeopardy*! For $100, the answer is: A device that operates in a cycle. It extracts heat from a cold reservoir and rejects the rest of the heat hot reservoir. This process requires an input of work. The work energy is rejected to the hot reservoir too. The device needs a working fluid that absorbs and rejects the heat and has work done on it. At the end of a cycle, the working fluid has returned to its orginal state. The device is a heat engine run in reverse. However, there are very few heat engines that are designed to run in reverse."

   What is a _____, Alex?

   a) working fluid   b) piston   c) cylinder   d) refrigerator   e) heat engine

021 qmult 00200 1 1 3 easy memory: heat energy refrigerator efficiency
6. The performance of heat engines and refrigerators need to be evaluated in many ways since they are used in many ways. However, a generally useful performance measure for a heat engine is the efficiency defined by

$$\varepsilon = \frac{W}{Q_{\mathrm{H}}} = \frac{Q_{\mathrm{H}} - Q_{\mathrm{C}}}{Q_{\mathrm{H}}} = 1 - \frac{Q_{\mathrm{C}}}{Q_{\mathrm{H}}} \ ,$$

where W is the work output, Q_{H} is the heat absorbed from the hot bath, and Q_{C} is the heat rejected to the cold bath. Two generally useful performance measures for a refrigerator are the heating and cooling coefficients of performance:

$$\eta_{\mathrm{heating}} = \frac{Q_{\mathrm{H}}}{W} = \frac{Q_{\mathrm{H}}}{Q_{\mathrm{H}} - Q_{\mathrm{C}}} = \frac{1}{1 - Q_{\mathrm{C}}/Q_{\mathrm{H}}} = \frac{1}{\varepsilon} \ ,$$

and

$$\eta_{\mathrm{cooling}} = \frac{Q_{\mathrm{C}}}{W} = \frac{Q_{\mathrm{H}} - W}{W} = \frac{1}{\varepsilon} - 1 = \eta_{\mathrm{heating}} - 1 \ ,$$

where W is the work input, Q_{H} is the heat rejected to the hot bath, Q_{C} is the heat absorbed from the cold bath, and ε is just a parameter in these equations not an efficiency since they are refrigerators, not heat engines. Given $Q_{\mathrm{C}}/Q_{\mathrm{H}} = 1/2$, what are the values of ε, η_{heating}, and η_{cooling}

   a) 1/2, 2, 1/2.   b) 2, 1/2, 2.   c) 1/2, 2, 1.   d) 2, 2, 1.   e) 1, 1, 0.

   SUGGESTED ANSWER: (c)

   Behold:

$$\varepsilon = 1 - \frac{Q_{\mathrm{C}}}{Q_{\mathrm{H}}} = 1 - \frac{1}{2} = \frac{1}{2} \ , \qquad \eta_{\mathrm{heating}} = \frac{1}{\varepsilon} = 2 \ , \qquad \eta_{\mathrm{cooling}} = \eta_{\mathrm{heating}} - 1 = 1 \ .$$

   Wrong answers:
   a) Third value is wrong.

021 qmult 00220 1 1 3 easy memory: reversible heat engine highest efficiency
7. The argument that a reversible heat engine—if it exists—is the most efficient heat engine and highest performance refrigerator (when run in reverse) is as follows. Imagine two identical reversibles: one runs forward as a heat engine and one runs in reverse as a fridge. For the forward/reverse engine let W be the work output/input, Q_{H} be the heat absorbed from/rejected to the hot bath, and Q_{C} be the heat rejected to/absorbed from the cold bath. We use the work output of the forward engine to drive the reverse engine. From an outside perspective, nothing happens averaged over an engine cycle. No net work is done and no net heat leaves or enters the baths.

   Now imagine a more efficient heat engine than the reversible and use it to replace the forward reversible. Scale it to reject Q_{C}. Since it is more efficient, it absorbs $Q'_{\mathrm{H}} > Q_{\mathrm{H}}$ and does work $W' > W$.

Now the net effect over a cycle is that net work $W' - W > 0$ is done and net heat $Q'_\mathrm{H} - Q_\mathrm{H}$ is removed from the hot bath and there is no net change to the cold bath. Thus, an amount of heat $Q'_\mathrm{H} - Q_\mathrm{H}$ is turned entirely into work with no other effect. This process is just never observed in nature and no one has ever been able to construct anything like it. It is a reasonable, but not incontrovertible, conclusion that the more efficient heat engine is impossible and the reversible—if it exists—must be the highest efficiency engine.

Now imagine a higher performance refrigerator than the reversible and use it to replace the reverse reversible. Scale it to use work W. Since it is higher performance, it absorbs $Q'_\mathrm{C} > Q_\mathrm{C}$ from the cold bath and rejects heat $Q'_\mathrm{H} > Q_\mathrm{H}$ to the hot bath. Now the net effect over a cycle is that net work is zero and net heat $Q'_\mathrm{H} - Q_\mathrm{H} = Q'_\mathrm{C} > Q_\mathrm{C}$ is removed from the cold bath and transferred to the hot bath. This process is just never observed in nature and no one has ever been able to construct anything like it. Heat does not spontaneously flow from hot to cold. It is a reasonable, but not incontrovertible, conclusion that the higher performance refrigerator is impossible and the reversible—if it exists—must be the highest performance refrigerator.

As a matter of fact, the _____ of thermodynamics (which is an axiom of thermodynamics) dictates the non-existence of the more efficient engine and the higher performance refrigerator, and therefore leads to the conclusion the reversible—if it exists—must be the most efficient heat engine and highest performance refrigerator.

Equation Sheet for Introductory Physics Calculus-Based

This equation sheet is intended for students writing tests or reviewing material. Therefore it is neither intended to be complete nor completely explicit. There are fewer symbols than variables, and so some symbols must be used for different things: context must distinguish.

   The equations are mnemonic. Students are expected to understand how to interpret and use them.

1 Constants
