16.5 Second-Order Conservative Equations

Usually when you have a system of high-order differential equations to solve it is best to reformulate them as a system of first-order equations, as discussed in §16.0. There is a particular class of equations that occurs quite frequently in practice where you can gain about a factor of two in efficiency by differencing the equations directly. The equations are second-order systems where the derivative does not appear on the right-hand side:

$$y'' = f(x, y),$$
 $y(x_0) = y_0,$ $y'(x_0) = z_0$ (16.5.1)

As usual, y can denote a vector of values.

Stoermer's rule, dating back to 1907, has been a popular method for discretizing such systems. With h=H/m we have

$$y_1 = y_0 + h[z_0 + \frac{1}{2}hf(x_0, y_0)]$$

$$y_{k+1} - 2y_k + y_{k-1} = h^2 f(x_0 + kh, y_k), \qquad k = 1, \dots, m-1$$

$$z_m = (y_m - y_{m-1})/h + \frac{1}{2}hf(x_0 + H, y_m)$$
(16.5.2)

Here z_m is $y'(x_0 + H)$. Henrici showed how to rewrite equations (16.5.2) to reduce roundoff error by using the quantities $\Delta_k \equiv y_{k+1} - y_k$. Start with

$$\Delta_0 = h[z_0 + \frac{1}{2}hf(x_0, y_0)]$$

$$y_1 = y_0 + \Delta_0$$
(16.5.3)

Then for $k = 1, \ldots, m - 1$, set

$$\Delta_k = \Delta_{k-1} + h^2 f(x_0 + kh, y_k)$$

$$y_{k+1} = y_k + \Delta_k$$
(16.5.4)

Finally compute the derivative from

$$z_m = \Delta_{m-1}/h + \frac{1}{2}hf(x_0 + H, y_m)$$
 (16.5.5)

Gragg again showed that the error series for equations (16.5.3)–(16.5.5) contains only even powers of h, and so the method is a logical candidate for extrapolation à la Bulirsch-Stoer. We replace mmid by the following routine stoerm:

```
SUBROUTINE stoerm(y,d2y,nv,xs,htot,nstep,yout,derivs)
INTEGER nstep,nv,NMAX
REAL htot,xs,d2y(nv),y(nv),yout(nv)
EXTERNAL derivs
PARAMETER (NMAX=50)
Maximum value of nv.
```

USES derivs

Stoermer's rule for integrating y''=f(x,y) for a system of n=nv/2 equations. On input y(1:nv) contains y in its first n elements and y' in its second n elements, all evaluated at xs. d2y(1:nv) contains the right-hand side function f (also evaluated at xs) in its first n elements. Its second n elements are not referenced. Also input is htot, the total step to be taken, and nstep, the number of substeps to be used. The output is returned as yout(1:nv), with the same storage arrangement as y. derivs is the user-supplied subroutine that calculates f.

```
ytemp(i)=y(i)+ytemp(n)
enddo 11
x=xs+h
call derivs(x,ytemp,yout)
                                      Use yout for temporary storage of derivatives.
h2=h*h
do 13 nn=2,nstep
                                      General step.
   do 12 i=1, negns
        n=neqns+i
        ytemp(n)=ytemp(n)+h2*yout(i)
        ytemp(i)=ytemp(i)+ytemp(n)
    enddo 12
    x=x+h
    call derivs(x,ytemp,yout)
enddo 13
do 14 i=1.neans
                                      Last step.
    n=neqns+i
   yout(n)=ytemp(n)/h+halfh*yout(i)
   yout(i)=ytemp(i)
enddo 14
return
END
```

Note that for compatibility with bsstep the arrays y and d2y are of length 2n for a system of n second-order equations. The values of y are stored in the first n elements of y, while the first derivatives are stored in the second n elements. The right-hand side f is stored in the first n elements of the array d2y; the second n elements are unused. With this storage arrangement you can use bsstep simply by replacing the call to mmid with one to stoerm using the same arguments; just be sure that the argument n of bsstep is set to 2n. You should also use the more efficient sequence of stepsizes suggested by Deuflhard:

$$n = 1, 2, 3, 4, 5, \dots$$
 (16.5.6)

and set KMAXX = 12 in bsstep.

16.6 Stiff Sets of Equations

As soon as one deals with more than one first-order differential equation, the possibility of a *stiff* set of equations arises. Stiffness occurs in a problem where there are two or more very different scales of the independent variable on which the dependent variables are changing. For example, consider the following set of equations [1]:

$$u' = 998u + 1998v$$

$$v' = -999u - 1999v$$
(16.6.1)

with boundary conditions

$$u(0) = 1 v(0) = 0 (16.6.2)$$
