7. The solar constant (i.e., the electromagnetic radiation energy per unit time per unit area from the Sun at 1 astronomical unit from the Sun) is about 1367.6 watts per square meter. If you were at 1 astronomical unit from the Sun in space and had a square kilometer of solar panels (of 100 % efficiency), how many 100 watt light bulbs could you run on solar power?

8. “Let’s play *Jeopardy!* For \$100, the answer is: This astrophysical body has three main interior layers: 1) a core (in which thermonuclear reactions occur) that extends out to about 25 % of the body’s radius; 2) a radiative transfer zone which extends **OUT** to about 71 % of the body’s radius; 3) a convective zone that extends **FROM** about 71 % of the body’s radius to the body’s surface.”
 

What is \_\_\_\_\_, Alex.

  - a) the Moon    b) Venus    c) the Milky Way    d) the Earth    e) the Sun
9. Out to about 71 % of the Sun’s radius, the dominant energy transfer mechanism is:
  - a) electron conduction.    b) neutrino transfer.    c) radiative transfer (i.e., transfer by electromagnetic radiation).    d) convection.    e) an explosive shock wave.
10. Why can’t we see deeper into the Sun than the photosphere?
  - a) Line spectra overlap too severely at deeper layers.
  - b) The question is absurd. We see right through the photosphere to the bottom of the convection layer.
  - c) The question is absurd. Solar flares prevent any observation deeper than the chromosphere.
  - d) Radiation from deeper layers escapes too easily.
  - e) Radiation from deeper layers is absorbed before it can escape the Sun.
11. A granule is:
  - a) a kind of cereal.
  - b) a grain of dust.
  - c) the top of a rising current of **HOT** gas in the Sun. Granules are seen in the solar photosphere. They last about 10 minutes and then lose their identity with their surroundings. The risen gas **COOLS** and then sinks.

- d) the top of a rising current of **COLD** gas in the Sun. Granules are seen in the solar photosphere. They last about 10 minutes and then lose their identity with their surroundings. The risen gas **HEATS** up and then sinks.
- e) a solar flare by another name.
12. The five outermost layers of the Sun (defining layers of the Sun generously) can be labeled:
- convection zone, photon, chromosome, coronation street, and solar sail.
