Name:

Intro Astro Lab Prep Quiz: Lab 9: Double Stars

Instructions: There are 10 multiple-choice problems each worth 10 marks for a total of 100 marks altogether. Choose the **BEST** answer, completion, etc., and **DARKEN** fully the appropriate circle on the table provided below. Read all responses carefully. **NOTE** long detailed responses won't depend on hidden keywords: keywords in such responses are bold-faced capitalized.

This is a 10 minute quiz.

	a	b	с	d	e		a	b	с	d	е
1.	Ο	Ο	Ο	Ο	0	6.	Ο	Ο	0	0	Ο
2.	Ο	Ο	0	Ο	0	7.	0	0	0	0	Ο
3.	0	0	0	Ο	0	8.	0	0	0	0	Ο
4.	0	Ο	0	Ο	0	9.	Ο	Ο	0	Ο	Ο
5.	0	Ο	0	Ο	0	10.	Ο	Ο	Ο	Ο	Ο

Answer Table for the Multiple-Choice Questions

009 qmult 00100 1 4 1 easy deducto-memory: double star defined @ prep

1. "Let's play Jeopardy! For \$100, the answer is: Two stars that appear very close on the sky to an observer. Usually the observer is using a telescope."

What is a , Alex?

a) double star b) visual binary c) spectroscopic binary d) close binary e) doubloon star

SUGGESTED ANSWER: (a)

Wrong answers:

a) Avast matey, AAaaargh.

Redaction: Jeffery, 2013jan01

009 qmult 00110 1 1 4 easy memory: binary defined @ prep

2. A double star that is gravitationally bound is a:

a) single star. b) bound pair. c) gravitational pair. d) binary. e) triple.

SUGGESTED ANSWER: (d)

Wrong answers:

a) Oh, c'mon.

Redaction: Jeffery, 2013jan01

009 qmult 00120 1 1 5 easy memory: binaries classified @ prep

3. Visual binaries, spectroscopic binaries, wide binaries, close binaries are, respectively:

- a) detected by eye only, spectrumless, transferring light, affectionate.
- b) detected by spectroscopy, detected by imaging, always transferring mass, gravitiationally interacting only.
- c) detected by imaging, detected by spectroscopy, always transferring mass, gravitiationally interacting only.
- d) detected by spectroscopy, detected by imaging, gravitationally interacting only, sometimes transferring mass.

e) detected by imaging, detected by spectroscopy, gravitationally interacting only, sometimes transferring mass.

SUGGESTED ANSWER: (e)

Wrong answers:

a) A nonsense answer.

Redaction: Jeffery, 2013jan01

009 qmult 00200 1 1 3 easy memory: angular resolution and Rayleigh criterion @ prep

4. In one meaning the term angular resolution is the ability to tell two objects apart in a optical imaging device. However, a precise meaning for the angular resolution for optical imaging device with a circular apperature is the angle

$$\theta_{\rm R} \begin{cases} = 1.219669891 \dots \text{ radians} \times \frac{\lambda}{D} \\ \approx 1.220 \text{ radians} \times \frac{\lambda}{D} \\ \approx 25.16'' \times \frac{\lambda_{\mu\rm m}}{D_{\rm cm}} \\ \approx 9.905'' \times \frac{\lambda_{\mu\rm m}}{D_{\rm in}} \\ \approx 4.952'' \times \frac{(\lambda_{\mu\rm m}/0.5\,\mu\rm{m})}{D_{\rm in}} , \end{cases}$$

where λ is wavelength, D is the diameter of the aperature, $\lambda_{\mu m}$ is wavelength in microns (μm), D_{cm} is the diameter of the aperature in centimeters, and D_{in} is the diameter of the aperature in inches. If two point sources at optical infinity are farther apart in angle than about θ_R , they can usually be resolved. If they are closer than about θ_R , then in practice they often cannot be resolved. If you have very high quality observations, you might be able to resolve them if they are somewhat closer than θ_R . The angle θ_R is set by the diffraction of light. The angle θ_R is called the ______ criterion.

a) Kelvin. b) Raleigh c) Rayleigh d) Born e) Newton-John

SUGGESTED ANSWER: (c)

Wrong answers:

- d) Max Born coauthored a famous book on optics, but no it's not him.
- e) Max Born's granddaughter Olivia Newton-John did not coauthor a famous book on optics, but it's still not her.

Redaction: Jeffery, 2013jan01

009 qmult 00300 1 1 4 easy memory: Kepler's 3rd law @ prep5. The word formulation ofis period squard is proportional semi-major axis cubed.

a) Newton's 2nd law b) Rayleigh's 3rd law c) Rayleigh's criterion d) Kepler's 3rd law e) Newton's 3rd law

SUGGESTED ANSWER: (d)

Wrong answers:

a) Oh, c'mon.

Redaction: Jeffery, 2013jan01

009 qmult 00310 1 1 1 easy memory: Kelper's 3rd law in small mass ratio approximation @ prep

6. Kepler's 3rd law (which applies to gravitationally bound two-body systems) in modern equation formulation is

$$P = \sqrt{\frac{4\pi^2}{G(M+m)}} \times a^{3/2}$$

where P is orbital period, G is the gravitational constant, M is the mass of the more massive body, m is the mass of the less massive body, and a is the semi-major axis of the relative elliptical orbit. If $m \ll M$, the formula can be approximated to good accuracy by replacing (M + m) by SUGGESTED ANSWER: (a)

Wrong answers:

c) Not dimensionally correct.
